                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The library was constructed by Claire Murphy and Dr. James McCarter at Washington University, St. Louis. This is a Oligo (dT)-SL1 PCR based library. cDMA PCR products of size >400 nucleotides containing SL1 on the 5' end and oligo (dT) on the 3' end were non-directionally cloned into pCRII-TOPO (Invitrogen) following the TOPO TA cloning protocol. Parasitic adult females were collected from immunologically naive animals and provided by Dr. Mark Viney (Mark Viney@bristol.ac.uk) of University of Bristol, Bristol, UK.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                est@watson.wustl.edu
                      Site 2: ECORI; The library was constructed by Claire Murphy and Dr. James McCarter at Washington University, St. Louis. This is a Oligo(dT)-SL1 PCR based library. cDNA PCR products of size >400 nucleotides containing SL1 on the 5' end and oligo(dT) on the 3' end were non-directionally cloned into pCRII-TOPO(Invitrogen) following the Topo TA cloning protocol. Parasitic adult females were collected from immunologically naive animals and provided by Dr. Mark Viney (Mark Viney@bristol.ac.uk)
of University of Bristol, Bristol, UK.
                                                                                                                                                                                                                                                                                                                                                    /dev_stage="Parasitic adult"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to

/note="Organ: leaf; Vector: RescueMu (engineered from
pBlueScript backbone); Site 1: BamHI; Site_2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.isetate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHI and BglII, and ligated to form circular plasmids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Biomedical Polymers Research Bldg.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMP42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Organ: leaf; Vector: RescueMu (engineered from
pBlueScript backbone); Site 1: BamHI; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
plates with ampicillin."

It indicates an insertion close to or within gene Atl330620. Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.

/clone lib="Arabidopsis thallana TDNA insertion lines for the process of the lines one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /db_xref="taxon:3702"

Location/Qualifiers
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the Dlunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pW042 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of the 5912 nucleic acid sequences or its complement or fragment) with a complementary nucleic acid molecule obtained from the bovine cell or tissue, where hybridisation between the marker nucleic acid and the complementary nucleic acid permits the detection of the molecule; and (b) detecting the level or pattern of the complementary nucleic acid, where the detection of the complementary nucleic acid is predictive of the level or pattern of the molecule. The LMFD nucleic acid is used for determining a level or pattern of a molecule in a bovine cell or tissue. It is useful for genome mapping, gene identification and analysis, cattle breeding, preparation of constructs for use in cattle gene expression, or for genetically improving cattle. The present sequence is one of the 5912 bovine LMFD EST (expressed sequence tag) nucleic acids. Note: The present sequence was not shown in the specification but was obtained in electronic format from the USPTO web site:
                                                                                                                                                                                                                                                                                                                                                                                                     Key

(I) is useful for treating a human having a disease or condition associated with (II) such as premature aging or a hyperproliferative disorder especially cancer, by inhibiting the expression of (II) in human cells or tissues. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. The products of the invention have cytostatic activity. This sequence represents an antisense oligonucleotide used to illustrate the method of the invention.

The invention relates to a method for trea or pulmonary inflammation in an individual antisense compound targeted to a nucleic a B7 protein. The invention also relates to

to a method for treating airway hyperresponsive ion in an individual comprising administering

hyperresponsiveness

þ human

acid molecule encoding a method of inhibiting coding B7-1 or B7-2. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MAP3K9 gene, polymorphism in Mapsky nucleur actu, with mind and processed Mind and processed mind activity and/or increased Mind protein expression, increased Mind in diagnosis or identification of Mind protein isoform expression; and in diagnosis or identification of susceptibility to asthma. The inhibitor is also useful for the treatment of other respiratory diseases associated with Map3K9 or other members of the JNK pathway such as chronic obstructive pulmonary disease, chronic bronchitis and other inflammatory diseases such as rheumatoid arthritis, psoriasis, multiple sclerosis and inflammatory bowel disease. This polymucleotide sequence represents a forward primer which is used in amplifying a marker of the Map3K9 kinase, where Map3K9 is a part of mirroren-activated Protein Kinase (MapK) signal transduction pathways, of
AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (1), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                             Claim 1; Page 2258;

The invention relates to a purified nucleic acid molecule associated with lactation or muscle and fat deposition (designated LMFD), derived from cattle, and the LMFD nucleic acid can specifically hybridise to a second nucleic acid molecule comprising any of 5912 nucleotide sequences, appearing as ABX50072-ABX55983, or complements of them. Also included are (1) a transformed cell having a nucleic acid comprising an LMFD nucleic acid linked to a promoter and a 3' non- translated sequence that functions in the cell to cause termination of transcription and addition of polyadenylated ribonucleotides to a 3' end of the mRNA molecule; and (2) determining a level or pattern of a molecule in a bovine cell or tissue comprising: (a) incubating a marker nucleic acid (comprising any
                                                                                                                                                                              Claim
                                                                                                                                                                                                     Purified nucleic acid molecules, useful for genome mapping, identification and analysis, cattle breeding or preparation for cattle gene expression and genetically improved cattle.
                                                                                                                                                                                                                                                                  WPI; 2003-102386/09

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymentides.

The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human transforming growth factor beta CC (TGFb) receptor (TGFb-R) gene by RNA interference. The siNAs may or may CC not comprise ribonucleotides and may be double or single stranded. They CC further comprise sense and antisense regions, or alternatively are CC assembled from a sense oligonucleotide and an entisense oligonucleotide. Specifically, the siNAs include short interferening RNA (siRNA), double-CC stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The siNAs CC can be unmodified or chemically modified, can contain CC deoxyribonucleotides, and can be chemically synthesised, expressed from a CC vector or enzymatically synthesised. The invention also relates to kits Cfor the in vitro or in vivo delivery of siNA, conjugates and/or complexes CC expression of the TGFb-R gene in cells, tissue explants or organisms CC (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating CC diabetic nephropathy, chronic liver disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target CC studying gene function, and gene mapping (e.g., of single nucleotide CC polymorphisms). The present sequence represents the lower strand of a CC human TGFb-R-targeted double-stranded siNA.

CC family kinase inhibitor for treating asthma. Where the asthma is statima, at-risk haplotype in MAPSK9 gene, polymorphism in MAPSK9 nucleic cc acid, dysregulation of MAPSK9 mANA expression, dysregulation of a MAPSK9 comman at-risk haplotype for cc acid, dysregulation of MAPSK9 mANA expression. The invention cc further comprises: a method for the diagnosis or identification of conclusions of diagnosing asthma, a method for the use of a first nucleic acid conclusions for diagnosing asthma or susceptibility to asthma in a sample; a cc method for assaying the presence of a first nucleic acid molecule in a cc method for assaying the presence of a first nucleic acid molecule; a method for assessing the response to treatment with an MLK cc family kinase nucleic acid inhibitor in a target population or in an cc individual with an at-risk haplotype for asthma, at-risk haplotype in the MAPSK9 mana, at-risk haplotype in the MAPSK9 mana, at-risk haplotype in the mapsky gene, polymorphism in the MAPSK9 nucleic acid, dysregulation of MLK1 protein isoform expression, increased MLK1 biochemical activity or increased Cc MLK1 protein isoform expression; a method for assessing the response to treatment with an at-risk haplotype for asthma, as above; a kit for assaying a sample for the presence or astence or astence or at least one haplotype comprising 2 or more alleles associated with asthma comprising; at least one haplotype, and reagent kit for assaying the presence of at least one haplotype in the presence of at least one haplotype at least one haplotype. The for the presence of at least one specific allele of comprising at least one nucleic acid capable of detecting the presence of at least one haplotype and a reagent kit for assaying at least one haplotype. The presence of at least one haplotype and a reagent kit for assaying at least one haplotype. The presence of at least one haplotype and a reagent kit for assaying at least one haplotype and a reagent kit for assaying at least one haplotype. The must form the presence o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADW81692/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   biological sample, in expression profiling studies, in qualitatively or control of quantitatively characterising the corresponding transcriptome, and in the corresponding transcriptome, and in transcriptomes. The libraries may also be used as specialised mini control of the corresponding transcriptomes. The libraries may also be used as specialised mini control of the corresponding the detection of tissue individual to pathology-specific genes such as those genes only expressed in specific tissue under a specific pathological condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular disorder. ABN27253 to ABN59589 represent oligonucleotide sequences from crats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

transcriptome comprises messenger RNAs transcriptom multiple
transcription units that populate a genome. The library comprises several
oligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
oligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profiling studies.

                                                                                                                                                                                                                                                                                                                                deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the TGFb-R gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating diabetic nephropathy, chronic liver disease or pulmonary fibrosis. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human TGFb-R-trargeted double-stranded siNA, which is identical to the TGFb-R trargeted double-stranded siNA, which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     11-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                            present invention describes these oligos as useful for uncleic acids and in particular for profiling mRNA splice variants, detecting mutations, deletions or duplications that may be associated with onset or increased risk of diseases such as cancer. Accordingly, such oligos exhibit cytostatic activities. Furthermore, these LNA such oligos exhibit cytostatic activities. Furthermore, these LNA such oligos exhibit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to novel non-naturally occurring nucleic acids that exhibit enhanced biostability and capture efficiency i.e. hybridisation. Specifically, it refers to locked nucleic acid (LNA) oligos that have restricted flexibility in the ribofuranose ring of the nucleoside due to the presence of a 2'-O, 4'-C methylene bridge. The present invention describes these oligos as useful for detecting target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          modified_base
                                                                                                                                                                                                                                                                                                                                                          containing oligos can be used as fluorescent in situ hybridisation (FISH) probes or on diagnostic microarrays to detect splice isoform signatures, as well as antisense oligos that can modulate or silence sense nucleic acid agents. This oligonuclectide sequence is a DNA oligo capture probe (that can optionally be LNA-modified) given in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New non-naturally-occurring nucleic acid having a melting temperature and capture efficiency higher than a control nucleic acid, useful for detecting and amplifying target nucleic acid, for alternative mRNA splice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kauppinen S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a DNA (I) that shows increased or decreased cc expression during biosynthesis of cell wall components or formation of cc wood fibre cells in a plant, comprising a nucleotide sequence that chybridises under stringent conditions with any of 1731 fully defined cc sequences (S1) of 60 nucleotides given in specification, or with a cnucleotide sequence encoding a protein having 50% or more homology with ct that encoded by (S1). Also included in the specification are: (a) a cc promoter DNA (II) of (I); (b) a DNA comprising a nucleotide sequence that cc is complementary to (I) or nucleotide sequence that codes RNA, which cc suppression effect; (c) a recombinant vector (III) comprising (I); (d) a comprising (III); and (f) a transformed plant cell (IV) cc comprising (III); and (f) a transformed portion (V) obtained from (CC incorphological formation of wood fibre cells. This sequence corresponds to an expressed sequence tag (BST) fragment relating to the DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                      AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'- untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single-stranded DNA for identifying gene signatures directed human cDNA library that reflects relative amRNA in specific human tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-JUL-1996

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This sequence represents a primer used to isolate polymucleotides encoding Helicobacter pylori proteins for studies on protein-protein interactions

This primer is used for amplifying human leptin receptor gene by RT-PCR from human abdominal fat mENA, which is used for screening an adipose tissue-derived chicken cDNA (11 corresponding DNA molecule. Leptin receptor is used for regulating corresponding DNA molecule. Leptin receptor is used for regulating corresponding bnA molecule. Leptin receptor is used for regulating consumption, fat deposition, puberty, thermoregulation, immunity, and energy expenditure. Leptin receptor is specifically used consumption, fat deposition, puberty, thermoregulation, immunity, and energy expenditure. Leptin receptor is specifically used for attenuating leptin activity in vivo (particularly using a soluble for attenuating leptin activity in vivo (particularly using a soluble form a transgene). Leptin receptor provides a replacement for the forced molting procedure to improve performance and profitablity of old laying hens. The invention correction is also used to isolate leptin gene and to establish a bioassay for leptin activity, e.g. to screen for birds with high or low leptin levels in the blood (e.g. for breeding purposes) and/or for isolation of

CR Also disclosed is a method of gene expression analysis. The array is used in monitoring gene expression levels by hybridisation to a DNA library, is compounds. The nucleic acid probes are specifically designed for analysis of genetic variation or in hybridisation of taglabelled compounds. The nucleic acid probes are specifically designed for analysis of at least one target sequence. The method of analysis comprises comparises the following at least one or more nucleic acids to at least two or more concluding at least one or more nucleic acids to at least two or more concluded analysis comprises monitoring gene expression levels, identifying biallelic markers or polymorphisms, confidence acids further comprises a tag sequence. The array of nucleic acid concluded acids further comprises a tag sequence. The array of nucleic acid composes is useful in in situ hybridisation, in Southern, Northern or dottolled hybridisation to identify or detect the sequence or specific contactions of any gene, in mapping the 5' termini of mRNA molecules by primer extensions or in screening CDNA or genomic libraries or subclones
                                            Matches
                                                                           Query Match
                                                                                                                Sequence
                                                                                                                                                                 for additional subclones containing segments of DNA that have been isolated and previously sequenced. The sequence presented is one of the nucleic acid probes incorporated in the microarray. Note: The sequence data for this patent can also be obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention discloses a microarray comprising a plurality of acid probes including one of 2,018,500 fully defined sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New array of nucleic acid probes, useful for in Southern, Northern or dot-blot hybridization to sequence or specific mutations of any gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; SEQ ID NO 4223; 9pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Clupus-affected or lupus-predisposed tissues as compared to disease-free cc tissues, a variant of the polypeptide and a polynucleotide encoding the clubus-gredisposed tissues as compared to disease-free cc tissues, a variant of the polypeptide and a polynucleotide encoding the cc polypeptide or variant. The invention also relates to detecting an cc subject and comparing the expression profile to a reference expression cc profile of the gene to detect or monitor an autoimmune disease in a cc subject, where the gene is differentially expressed in pre-symptomatic lupus-affected or lupus-predisposed tissues as compared to disease-free cc tissues, administering a therapeutically or prophylactically effective camount of the pharmaceutical composition in a subject, preferably a human cc ease in the cells before and after the contacting to determine if the capent modulates expression profiles or protein activities of at least come gene in the cells before and after the contacting to determine if the agent modulates expression or protein activities of at least one gene in the biological sample before and after the administering to determine if the least one gene in the subject, where the gene is differentially expressed cc disease-free kidney tissues. The pharmaceutical composition is useful for diagnosing, treating and preventing autoimmune diseases such as lupus repeated sinuman lupus-related sinum target sequence of the invention. Note: The cc muman lupus related sinum target sequence of the invention. Note: The cc sequence data for this patent did not form part of the protein activited.

CC carrier and at least one active component selected from a polypeptide concoded by a gene that is differentially expressed in pre-symptomatic cC lupus-affected or lupus-predisposed tissues as compared to disease-free ctissues, a variant of the polypeptide and a polynucleotide encoding the colypeptide or variant. The invention also relates to detecting an cc expression profile of at least one gene in a biological sample of a cc subject and comparing the expression profile to a reference expression cc subject, where the gene is differentially expressed in pre-symptomatic cc lupus-affected or lupus-predisposed tissues as compared to disease-free ctissues, administering a therapeutically or prophylactically effective camount of the pharmaceutical composition in a subject, preferably a human cc ease in the cells before and after the contacting to determine if the agent modulates expression profiles or protein activities of at least cone gene in the biological sample before and after the contacting to determine if the agent modulates expression or protein activities of at least one gene in the biological sample before and after the administering to determine if the agent modulates expression or protein activities of at least one gene in the biological sample before and after the administering to determine if the least one gene in the subject, where the gene is differentially expressed in lupus-affected or lupus-predisposed confidence in activities of at least one gene in the biological sample before and after the administering to determine if the least one gene in the subject, where the gene is differentially expressed in lupus-affected or lupus-predisposed subject confidence in activity of at least one gene in the subject, where the gene is differentially expressed in lupus-affected or lupus-predisposed subject.

CC disposing, treating and preventing autoimmune diseases such as lupus expressed in a lupus related slawn target sequence of the printed.
                                    sequence data for this patent did not form part of the specification, but was obtained in electronic format at ftp.wipo.int/pub/published pot sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        26-FEB-2003; 2003US-0449693P

                                                                                                                                                                                                                                                                                                                        cytokine (TRANCE), osteoprotegerin ligand (OPGL), osteoclast differentiation factor (ODF) and TNFSF11. The present invention describes a screening method to identify potential therapeutic agents with osteopathic activity that can affect bone metabolism and are useful for the treatment or prevention of osteoporosis. As such, it refers to administering this agent to the mouse model and assessing the mouse for an alteration in a bone metabolism related marker such as RANKL. Furthermore, it describes a method for testing a mouse model for bone metabolism disease by administering an antisense oligonucleotide to modulate RANK or RANK or RANKL mRNA expression, and subsequently administering PTH to the mouse in order to assess the effect of the antisense oligo on the mouse compared to a control mouse treated with calcitonin. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Specifically, it refers to a mouse that is exposed to a compound selected from parathyroid hormone (PTH), its analogue or a fragment thereof, for a time sufficient to allow serum calcium concentration and the receptor activator of NFkappaB ligand (RANKL) mRNA expression to increase in the mouse model. Note that the RANKL gene maps to human chromosome 13q14 and is also known as tumor necrosis factor (TNP)-related activation-induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New mouse model exposed to parathyroid hormone (PTH), its analog or fragment so that serum calcium concentration and RANKL mRNA expression

                                                                                                                                    targeted to nucleobases 96-523 of a coding region of a nucleic acid molecule encoding human superoxide dismutase 1, soluble comprising 874 bp fully defined in the specification, where the compound specifically hybridizes with and inhibits the expression of human superoxide dismutase 1, soluble. The compound is useful for modulating of superoxide dismutase 2, soluble expression or for treating diseases associated with expression of superoxide dismutase 1, soluble. It can also be used to prevent or delay infection, inflammation, or tumor formation. This sequence corresponds to an antisense oligonucleotide targeted to the rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.

                                                                                                                             The invention relates to an antisense compound 8-50 nucleobases in length targeted to nucleobases 96-523 of a coding region of a nucleic acid molecule encoding human superoxide dismutase 1, soluble comprising 874 bp fully defined in the specification, where the compound specifically hybridizes with and inhibits the expression of human superoxide dismutase 1, soluble. The compound is useful for modulating of superoxide dismutase 1, soluble expression or for treating diseases associated with expression of superoxide dismutase 1, soluble. It can also be used to prevent or delay infection, inflammation, or tumor formation. This sequence corresponds to an antisense oligonucleotide targeted to the rat superoxide dismutase 1 gene for inhibition of gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2'-methoxyethyl; phosphorothicate.

Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymorph
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or example.

The compound is useful for modulating of superoxide dismutase 1, soluble expression or for treating diseases associated with expression of superoxide dismutase 1, soluble. It can also used to prevent or delay infection, inflammation, or tumor formation. This sequence corresponds to an antisense oligonucleotide targeted to the rat superoxide dismutase 1 gene for inhibition of gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC toxicological response to an agent, which comprises comparing the capression profile of one or more human toxic response genes to a cc reference gene expression profile indicative of toxicity, and so cc determining the presence of a toxic response to the agent. Also cc determining the presence of a toxic response to the agent. Also cc from the genes corresponding to the partial sequences given in ABZ82842 cc from the genes corresponding to the partial sequences given in ABZ82842 cc response gene plays a role on toxic response pathways by determining the cxpression profile of the gene after exposure of cells or a human subject to a known toxic pharmaceutical or industrial agent, comprising: (a) cc expression profile to an agent; (b) obtaining the test gene expression profile corresponse gene plays a role on toxic response gene plays a role on toxic response gent, comprising: (a) cc exposing cells to an agent or isolating cells from a human subject who cc was exposed to an agent; (b) obtaining the test gene expression profile corresponse gene after exposure to a known toxic response gene after exposure to a known toxic pharmaceutical or industrial agent; and (c) comparing the test profile to the expression profile of a gene with a similar function or comparing the test profile to the expression profile of that gene after comparing the test profile to the expression profile of that gene after comparing the test profile to the expression profile of that gene after compounds. The marrays comparing the test profile of a gene with a similar function or system level. The arrays comparising the human genes are useful for toxic cological servening to drugs, pharmaceutical compounds and chemicals

CC sequence or SEQ ID NOS: 1-23/ OF INDSTRAIL COMBETVALIAL SITE AND CC polypeptide of SEQ ID NOS: 261-497, where the polymurlectide encodes a complete of SEQ ID NOS: 261-497 and comparison of SEQ ID NOS: 261-497 and comparison of SEQ ID NOS: 361-497 and comparison of SEQ ID NOS: 471-697. Also described care: (1) a DNA construct comprising at least one polymurlectide having the sequence of SEQ ID NOS: 1-237 or their conservative variants; (2) a comparison of SEQ ID NOS: 471-697. Also described the sequence of SEQ ID NOS: 1-237 or their conservative variants; (2) a comparison of SEQ ID NOS: 1-237 or their conservative variants; (2) a comparison of SEQ ID NOS: 1-237 or their conservative variants; (2) a comparison of making wood or wood pulp obtained from a transgenic comprising an amino acid sequence encoded by the new isolated comprising an amino acid sequence encoded by the new isolated (1); (6) a comparison of an method of correlating gene expression in two different samples; (1) a method of correlating gene expression of a plant phenotype of a plant; (9) combination, for detecting expression of a plant phenotype to the level of comparison of a nucleic acid sequence of SEQ ID NOS: 1-237 or to gene expression in the plant of one or more genes; (11) a method of correlating the combination of the cell cycle; (12) a combination, for detecting expression of a plant phenotype to the level of comprising the combination of (12) provided on a solid conscravay comparising the combination of (12) provided on a solid conscravay comparising the combination of (12) provided on a solid conscravay comparison, comparison of conserving one or more nucleic acid sequence of SEQ ID NOS: 1-237; (13) a conscravay construct, composition, comparison of the cell cycle and (16) a kit, for cell cycle and methods are useful for modelypeptides, DNA construct, composition, comparison the microarray of the cell cycle enes.

CC and methods are useful for modelypeptides, DNA construct, composition, comparison the microarray for detecting one o

HDAC2 is also known as HDAC-2, hdac2, human RPD3 and hRPD3. The composition comprises antisense compounds that can be targeted towards HDAC2. The compound is useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. It is also useful in antisense gene therapy. The present sequence is human HDAC2 DNA target region. Human HDAC2 gene is located at chromosome 6q21.

HDAC2 also known as HDAC-2, hdac2, human RPD3 and hRPD3. The composition comprises antisense compounds that can be targeted towards HDAC2. The compound is useful for preparing a composition for treating hyperproliferative disorders, e.g., cancer. It is also useful in antisense gene therapy. The present sequence is an antisense oligonucleotide targeted to human HDAC2 DNA.

                                                                                                                                                                                  The present invention relates to antisense compounds, compositions and methods used for modulating histone deacetylase 2 (HDAC2). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of histone deacetylase 2, such as a hyperproliferative disorder (cancer), a condition involving an inflammatory response or an aberrant apoptosis and a metabolic disorder. The invention is also useful in antisense-therapy. The present sequence is human histone deacetylase 2 target DNA fragment used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Histone deacetylase 2; HDAC2; diagnosis; prevention; hyperproliferative disorder; cancer; apoptosis; metabolic antisense-therapy; cytostatic; antiinflammatory; human; de

The present invention relates to antisense compounds, compositions and methods used for modulating histone deacetylase 2 (HDAC2). The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of histone deacetylase 2, such as a hyperproliferative disorder (cancer), a condition involving an inflammatory response or an aberrant apoptosis and a metabolic disorder. The invention is also useful in antisense-therapy. The present sequence is human histone deacetylase 2 DNA antisense oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense oligonucleotide compound, useful for diagnosing, p and/or treating conditions with aberrant activity of the histone deacetylase 2, such as cancer, inflammation and metabolic disord
